SUMMARY

Software Engineer specializing in full-stack web engineering and scalable backend architectures, now extending into applied AI: building LLM-integrated products using RAG pipelines, agentic workflows, and vector search. Adept at building production-ready systems with NestJS and Next.js, and at wiring LLM reasoning into existing backend architectures.

EDUCATION

St. Joseph's Institute of Technology
B.Tech: Artificial Intelligence & Data Science

2022 – 2026
CGPA: 8.33/10

TECHNOLOGIES

Languages: TypeScript, JavaScript, Python, Java, SQL

Frameworks & Libraries: NestJS, Next.js, Node.js, Express.js, React.js

AI / LLM Integration: LangChain, LangGraph, OpenAI API, Anthropic API, Retrieval-Augmented Generation (RAG), Agentic workflows, Prompt Engineering, Streaming/tool-calling with LLMs

Vector & Data: Vector embeddings, pgvector, Qdrant, PostgreSQL, MongoDB, NeonDB

Cloud, Tools & Databases: AWS (Redshift, Glue, Lambda, S3), Docker, Linux, TypeORM, Prisma, Firebase

EXPERIENCE

Cognizant Technology Solutions

2026

Programmer Analyst Intern

- Engineered an enterprise data warehouse solution utilizing AWS Redshift, optimizing complex analytical query execution and reducing transaction retrieval time for large-scale datasets.
- Deployed scalable, event-driven ETL pipelines leveraging AWS Glue, Lambda, and S3 to orchestrate automated data ingestion, normalization, and relational transformation workflows.

ADRIG AI Technologies Pvt. Ltd.

2025

SDE Intern

- Architected a high-throughput integration layer and core compliance platform, implementing secure communication bridges via Microsoft Graph and Shopify REST/GraphQL APIs.
- Engineered an intelligent processing engine featuring proprietary OCR subsystems and relational document parser models, accelerating document validation pipelines.
- Optimized backend architecture latency and query efficiency by restructuring complex database schemas and legacy enterprise API endpoints.

PROJECTS

RAG-Based Document Q&A Assistant | *LangChain, OpenAI API, pgvector* | GitHub

- Built a Retrieval-Augmented Generation pipeline that chunks and embeds multi-format documents (PDF, DOCX, TXT), retrieves relevant context via pgvector similarity search, and generates grounded, cited answers using the OpenAI API.
- Used LangChain to orchestrate the retrieval-generation flow, implementing chunking strategy tuning and re-ranking to cut hallucinated responses on domain-specific queries.
- Streamed responses to a Next.js frontend via the Vercel AI SDK, adding source-citation highlighting and conversation memory for follow-up questions.

AI Workspace (Collaborative AI-Powered Workspace) | *Next.js, NestJS, LangChain.js, BullMQ, OpenAI API* | GitHub

- Built a real-time collaborative workspace where multiple users co-edit documents while an embedded LLM agent summarizes, drafts, and answers questions grounded in the shared workspace content.
- Used LangChain.js on a NestJS backend to orchestrate retrieval and generation, letting the in-app assistant cite and pull context from teammates' notes and files during a session.
- Queued long-running AI tasks (summarization, batch drafting) through BullMQ against the OpenAI API, keeping the editor responsive while jobs processed asynchronously in the background.

Code-Sync (Distributed Collaborative IDE) | GitHub

- Designed a state-synchronized collaborative environment using WebSockets, establishing concurrent bidirectional event-streaming layers to support multi-client real-time editing rooms.
- Implemented operational-transform-style conflict resolution to keep multiple cursors and edits consistent across clients with minimal latency.
- Added room-based session management with live presence indicators and reconnect handling for dropped WebSocket connections.
